

IN THE SPECIFICATION

The paragraph bridging pages 12 and 13:

As the result, when $\Delta N > N_{in} - N_t$ and the difference of revolutions ($N_{in} - N_t$) is ~~larger~~ smaller than the target rotational difference ΔN , the processing routine advances from step S5 to step S6 whereupon the driving duty ~~duty~~ of the duty solenoid valve is reduced by a set value α corresponding to the difference ($duty - duty - \alpha$). When $\Delta N < N_{in} - N_t$ and the difference of revolutions ($N_{in} - N_t$) is ~~smaller~~ larger than the target rotational difference ΔN , the processing routine advances from step S5 to step S7 whereupon the driving duty ~~duty~~ of the duty solenoid valve is increased by the set value α corresponding to the difference ($duty - duty + \alpha$).
